Sdcard org s formatter

Formatting your SD card before use is an important step for all photographers. In this post, you'll learn how to format an SD card and avoid corrupt and half full cards before a shoot. We cover formatting in Windows 10, Mac, in camera (GoPro and DSLR), and using CMD. 5 Ways to Format an SD Card Here are the specific steps for formatting your SD card in these different methods. Three of the following methods require you to connect directly to your computer. If you need some help connecting, here are 4 ways to do this. And here's how to overcome connection problems. Can you just delete the files instead of reformatting the card? Yes. But I don't recommend it. See more about the delete vs reformat debate at the end of the post. First Step: Upload Your Files You're not going to want to forget this step. If you just jump into the guides below, and forget this step, you'll lose all your photos and videos. Please remember, once you reformat an SD card, all your media will be permanently gone. Okay, with this reminder out of the way, let's get on to successfully scrubbing your SD cards. 1. How to Format an SD Card on Windows 10 Here's how to format your SD card in your computer running Windows 10. It's a simple process. First, here's what you'll need: Computer running Windows 10 Micro SD card adapter / USB micro SD card reader (If using micro SD card): To enable your computer to read your memory card, you'll need an adapter (that will allow you to insert in a SD card port in your computer) or a microSD card reader (that can be inserted in your USB port on your computer). SD card port (built in) or SD card reader: If using a standard size SD card, you'll need a port in your computer, or a USB card reader. Insert your SD card into your computer, using either the SD card slot or USB port (with reader). If the card isn't recognized automatically, press Window Key + E. This will open File Explorer. Navigate to "This PC" in the left sidebar. Your SD card should be visible under this header. Right click on your SD card and select "Format". Here you can add "Volume Label" and give a name to your SD card. You'll see a warning message (Formatting will erase ALL data). Click OK (if you already backed up your photos and videos). Once it completes formatting, you'll see the "Format Complete" window. Click OK to close window. Screen shot from step 3: Right click and click Format. Screen shot from step 4: Customize settings and add Volume Label This is the success message you'll see once the card has been successfully formatted. You have now successfully formatted your SD card using your Windows 10 computer. And you're ready to head out on your next adventure with a fresh memory card. You can also select "Restore Device Defaults" to factory reset the card to its original settings. 2. How to Format an SD Card on Mac Here's how to format your SD card on your Mac computer. It's also a very simple process. Here's what you'll need: Mac computer SD card reader: If using a standard size SD card, you'll need a a USB SD card reader. If using microSD card you will need either a microSD card adapter or USB microSD card reader. Insert your SD card into your computer using your external card reader. Open Disk Utility. Navigate to your SD card. If it is a new card, it will probably be named "untitled" or "no name". Click the "Erase" tab. Then select "Format". Choose MS-DOS (FAT32) if your card is 32GB or smaller. Select exFat if your card is 64GB or larger. You'll see a confirmation message: "Are you sure you want to erase the partition "[your card name]"? Click "Erase". You have now successfully formatted your SD card on your Mac. See more on FAT32 / exFAT setting at the end of the post. 3. How to Format an SD Card on GoPro Camera It's my preference to format SD cards inside of the camera. I feel more confident that they are set up correctly for that model. GoPro cameras add a basic file structure when the card is formatted in-camera. Unlike the first two options, you don't really need any additional gear. You already own the camera and microSD card. Here's how to do it. If you're familiar with your camera, here's how to format the card: Menu > Preferences > Reset > Format SD Card Here is the step by step instructions. These instructions are for the Hero8, but will work almost identically for the previous models (especially the Hero5, Hero6, and Hero7 models). With the camera on, swipe down to view Menu. Tap Preferences. Scroll to bottom and tap Reset Tap Format SD Card (Top option) Tap Format (confirming that you'll delete all your files and reformat the card). Congratulations! You just formatted your microSD card with your GoPro camera. Here are four ways to delete GoPro videos. 4. How to Format an SD Card on a Canon DSLR I prefer this method for formatting SD cards for my DSLR. Because it is formatted inside the camera, I feel it will be less glitchy. And so far so good! And just like the previous method, you don't need any additional gear. You already own the camera and SD card. Here's how to do it on a Canon DSLR. The settings for Nikon and other DSLR cameras will be very similar. If you're familiar with your Canon camera, here's how to format the card: Menu > Camera Settings 1 tab > Format With the camera on, press Menu button. Navigate to the Camera Settings 1 tab. Select Format Select OK to format your card. And there you have it. You should always format your card the first time you use it. Avoid corrupt cards – and lost footage. If you don't know the last time it was formatted, just format it again. Corrupt card can cause your camera to freeze. More space: Instead of just removing a few photos and video files at a time, just upload the data and reformat. It's always better to start a shoot with an empty card. Prepare your card for another camera. File structure and type vary from one camera to the next. Avoid unnecessary glitches when switching cameras by reformatting. Learn more about SD card capacity of photos and videos. Which File System is best for high capacity memory cards? FAT32: This is the recommended file system for SD and SDHC memory cards. It is limited to a 4GB size for individual files. exFAT: This file system replaces FAT32 and is an acronym for Extended File Allocation Table. This system allows for individual files larger than 4GB. And for larger SD cards, this is the default file system. This is the recommended file system for SDXC memory cards. Given the video capability of digital cameras, it doesn't take long to create a single video file larger than 4GB. Especially if shot in 4K with a high bitrate. More reading: How to choose the best microSD card for your GoPro Your Turn Have a question about one of these methods for formatting SD cards? Or have a tip to make it better? Or maybe another method? Join be below! Bryan Haines is co-founder and blogger on ClickLikeThis. We cover action cameras and outdoor photography with a focus on GoPro cameras.
