Niresh mavericks dmg google drive.

So over the years I have successfully installed OSX on several computers that are not compatible with OSX. In the early days it was a real pain to get something stable to work with, and the end result was not really worth the trouble. Now, although everything has changed, with Intel-based Mac it has never been easier. There are smart people in Niresh who have made a very easy installation package for OSX to work on Intel and some AMD machines. Be sure to take a look at the Niresh Facebook page (click here) to show some appreciation. Here is a guide to installing OSX on a PC (credit goes to Technofidy) Note that if you have already installed any previous version of Mac OS X, then it will automatically upgrade to Mavericks. What do you need? A Hackintosh-compatible computer that can run Mac OS X. Note that all computers will not work with Mac OS X. But you can check if you try, who knows if your computer can run it. Mavericks will require a minimum of 10 GB of free space, but we recommend that you keep the size at least 6GB and use a completely empty drive. If you can create a separate partition on your hard drive for Mavericks, then that will be great. Download Niresh 10.9 ISO file from here. The file size is 6GB and you can use any torrent client like Utorrent to download it. By clicking the Download button on the Niresh website, you will see that the option one will be "ISO Version" and another "USB Version" of "Niresh 10.9 Mavericks." You can download the one you like, but we recommend that you choose the DMG version. A USB controller with at least 6GB or more space. Win32 Disk Imager, to burn Niresh disk image files to your USB drive. Multibeast Creating Niresh Install USB Drive. Connect your USB drive to your computer. Now you have to format your USB drive, to do so right click on the and select the option "Format...". Now open the "Win32 Disk Imager" you have downloaded a few minutes ago. Now, after opening the Win32 Disk Imager, click on the blue file icon and you will be asked to select your downloaded Niresh disk image. Please be sure to select "From the option menu" file, otherwise you will not show the Niresh file. After choosing the "OSX-MAVERICKS.DMG" file, select the letter of the unit and click on the "Write". After about 10 minutes the process will be completed. BIOS Configuration Note before starting the installation process, boot another drive to Mac OS X. Restart your computer and open the BIOS. You can do this by clicking on Setup key such as DEL/ESC or F10 until you see the screen. Now in the BIOS Change the option "First boot order" to "USB-IDE". Control panel PCH SATA -> A "SATA" or "IDE" > "AHCI". Select A "Save and Exit" Installing Niresh Now restart your computer and connect your A "USB-NIRESH". Your computer will start from the USB drive and you will see the screen below. Press the A "Enter Key" to start the Mavericks installer. Note that if you are using an AMD-based processor, you will have to type "AMD" or "AMD64" (without quotes) and then press A "Enter Key". Sometimes this boot indicator does not work, so at that time you will be asked to try another boot indicator as A "PCIFEX" and more. And if a panic or load error appears, then you have to try to write boot flags as pcrootuid = 0 or -x before pressing the ENTER key. If nothing works, you can try these boot indicators one by one, graphicsenabler = SA or graphicsenabler = no userkernelCache = SA or UsekerCache = No PCI = 0xA-2000 or PCI = 0xA-3000 PCIROOTUID = 1 O PCIROOTUID = 0 If you have Ethernet EthernetBuiltIn = SA for AMD users; AMD-VO AMD64 -Vo AMDFX_V for Atom users; Atom_V for HP Portable Users; HP_V Banner for laptops; x Now On the installation page. Go to "Utilities" and select "Disk Utility" option. You have to prepare your hard drive part to install Max OS X Mavericks. To do this, in the Disk Utility window choose the Hard Disk Partition on the left side (where you want to install Mavericks) and then click on the tab "Delete...". Please, make sure you select the "Mac OS Extended (registered)" A <in the Format option and you can name it as you wish. Now after the training you will see the recline icon created hard disk / disc partition in the installation window. Select this and click on the "Customized" button that you will find in the lower left corner of the window. Now here you can choose the drivers and KEXTS you want to install on your computer. But if you do not know much about that, then simply keep the default selection and select the option A "OK" now install Mavericks which will take about 30 minutes. See everything Once the installation process ends, disconnect your USB drive from your computer and restart, now you will see the icon on the hard drive, you just have to select it (where Mavericks installed) and, follow the configuration guide. Niresh will automatically install all necessary controllers or kexts. If something does not work as sound, Internet and more, then you can install A "Multibasta" to fix all that. To run MultibauSast in your MAVERICKS receipt operating system installed, go to the "Configuration" section in System Preferences and select the "General." section there you have to check A "anywhere" in the section A "Allow applications." After executing multibast, simply change the configuration of your BIOS to normal
