

How to unlock my android phone if i forgot my password

Continue

How to unlock android phone password if forgotten. Is there a way to unlock an android phone without password.

If you can't unlock your phone, you'll need to erase it. Then you can set it up again and set a new screen lock. If you can't sign in to your Google Account, learn how to recover your account. Erase your phone Important: These options will erase all data stored on your phone, like your apps, photos, and music. Data backed up to your Google Account can be restored later. Option 1: Erase your phone from another device To find, lock, or erase an Android phone, that phone must: Be turned on Be signed in to a Google Account Be connected to mobile data or Wi-Fi Be visible on Google Play Have Location turned on Have Find My Device turned on Learn how to remotely erase a phone. Option 2: Reset your phone with its buttons You can erase your locked phone using its power and volume buttons. To learn how to reset your specific phone this way, visit your manufacturer's support site. by Josh Kirschner on February 04, 2021 in Tips & How-Tos, Phones and Mobile, Cell Phones, Tech 101 :: 143 commentsTechlicious editors independently review products. To help support our mission, we may earn affiliate commissions from links contained on this page. If you forget your Android lock screen password, is there a way to unlock your phone? The short answer is no - you will have to factory reset your device to be able to use your phone again. And because all recent versions of Android encrypt the data on your phone by default, there is no way to recover any photos, contacts or other data that you haven't backed up to your Google account; they will be gone forever after the reset. However, at least your phone will be unlocked and you'll be able to use it again. There are two ways to factory reset an Android phone if you've forgotten the password and can't get past the lock screen. The first is to use Google's Find My Device, which allows you to remotely erase your phone online. If you don't have Find My Device turned on (it should be on by default), you'll have to use the second method, Android's "Recovery Mode". It's critical to note that resetting your phone through either of these methods will require you to know your Google account and password that was used to set up the phone. If you don't have this information, the device will be permanently locked. This security measure is in place to prevent a thief from using your device after factory resetting it. How to reset your Android phone through Find My Device Go to android.com/find. If you're not already, sign in to your Google account that is the main profile on your device. And if you have more than one device, select the phone you want to erase at the top left of the screen. Select ERASE DEVICE Click the ERASE DEVICE button Follow the steps to set up your phone again - note that you will need to verify the Google account information you originally used to set up the phone in order to proceed with setting up the device. How to reset your Android phone through Recovery Mode The steps to enter Recovery Mode varies by manufacturer, but I'll provide instructions for the major ones below. How to reset stock Android phones (Google Pixel or Nexus 6P): Hold down the Power button to power off your device. Press and hold the Power button and the Volume down button until your phone boots into Fastboot Mode. You'll see a bunch of system info, along with menus option on the right side of your screen. Use the Volume up and Volume down buttons to navigate through the menu options until you get to Recovery Mode, then press the Power Button to select it. You'll see the Google logo on a white background, then the Android mascot lying on his back and the words No command. Press and hold the Power button, then press the Volume up button. A new menu will pop up with a variety of system commands. Use the Volume buttons to get to Wipe data/factory reset and the Power button to select it. How to reset HTC phones: Hold down the Power button to power off your device. Press and hold the Volume down button, then press the Power button. Continue to hold Volume down until the Download mode is displayed A screen menu will appear. Use the Volume down button to highlight 'Recovery Mode'. Select 'WIPE DATA/FACTORY RESET'. Press the Power button to select. How to reset Huawei phones: Hold down the Power button to power off your device. Press and hold the Volume Up button and the Power button. Once the startup screen appears, release the Power button, and 3 seconds later release the Volume Up button. Your phone will enter recovery mode Use the Volume buttons or touch the screen to select Wipe data/factory reset. On the screen that says, "Confirm wipe off all user data?" use the Volume buttons or touch the screen to select Wipe data/factory reset. How to reset LG phones: Hold down the Power button to power off your device. Press and hold the Volume down button and the Power/Lock button for approximately 10 seconds. Release both buttons when the System recovery screen is displayed. (Special note for LG V30: When the LG logo appears, quickly release and then re-hold the Power button while continuing to hold the Volume down button) Use the Volume buttons to scroll to 'Factory Data Reset'. Press the Power/Lock button to select. Press either of the Volume buttons to highlight Yes, then press the Power/Lock button to confirm. How to reset Motorola phones: Hold down the Power button to power off your device. Press and hold the Volume Down button and the Power button. When the options menu appears, use the Volume buttons to scroll to "RECOVERY MODE" Press the Power button to restart into Recovery mode. You'll see an image of an Android robot with a red exclamation mark. While holding down the Power button, press the Volume Up button. Use the volume buttons to scroll to "Wipe data/factory reset" and press the Power button to select it. Use the Volume buttons to scroll to "Yes" and press the Power button to select it. How to reset Samsung phones: Hold down the Power button to power off your device. Press and hold the Volume up button, the Power button and the Home button. When you feel the device vibrate, release ONLY the Power button. A screen menu will appear. When you see this, release the remaining buttons. Use the Volume down button to highlight 'Delete all user data'. Press the Power button to select. Press the Power button again to select Yes - delete all user data. For Samsung phones without a Home button (such as Galaxy S10, Galaxy S11, Galaxy S20, Galaxy S21, Note 20), Hold down the Power button to power off your device. Press and hold the Volume up button, the Power button and the Bixby button. When you feel the device vibrate, release all the buttons. The Android recovery screen menu will appear (may take up to 30 seconds). Use the Volume down button to highlight 'Wipe data/factory reset'. Press the Power button to select. Press the Power button again to select Yes - delete all user data. Note: Some have reported that, starting with Android 11, your device is now required to be connected to power via USB to go into recovery mode. I have not been able to test this. Updated 2/4/2021 for newer Samsung devices [Image credit: Josh Kirschner/Techlicious] Something went wrong. Wait a moment and try again. Dr.Fone is an all-in-one tool that allows you to completely recover lost files from your Android device and unlock Android forgotten passwords. This cross-platform software can unlock a phone on which you forgot the Android password. This inbuilt feature allows you to remove the Android forgotten password while safeguarding your Android device's data files. Above all, as the best phone unlocking software, it is cost-effective and easy to use. It can remove 4 screen lock types - pattern lock, PIN, password & fingerprints. No tech knowledge asked everybody can handle it. Work for Samsung Galaxy S/Note/Tab series, LG G2/G3/G4, Huawei, Xiaomi, Lenovo, etc. Attention: When you use it to unlock Huawei, Lenovo, Xiaomi, the only sacrifice is that you will lose all the data after unlocking. Well, in a few minutes, you will unlock your Android phone's forgotten password with ease. First, download Dr.Fone and install it on your computer. Thereafter launch it and follow these steps. Step 1. Select the "Screen Unlock" option Once you have opened the program, select the "Screen Unlock" option directly. Next, connect your Android-locked phone and click on the "Unlock Android screen" button on the program window. Step 2. Set Your Phone to Download Mode To set your phone to download mode, you will have to follow the prompts on the screen. Firstly, you will need to Power off your Phone. Secondly, Press on volume down, home button, and power button simultaneously. Thirdly press the Volume up until the phone enters Download mode. Step 3. Download Package Recovery When the device detects that the phone is in "Download mode," it will then download the recovery package within minutes. Step 4. Start Removing Android Password After a complete download recovery package, the program will then remove the password screen lock successfully. You will have to confirm if your Android phone has a screen lock. This method is safe and secure, and all your data will be protected. Download Now Download Now Android normally secures your device by demanding a PIN, pattern, or full password. Your phone isn't useless if you forget the unlock code — you can bypass it and get back in. As Google tightens security, this has become more difficult on modern versions of Android. But there's always a way to make your phone usable again, as long as you remember your Google account's username and its password. Modern Versions of Android (5.0 and Up) Android used to have a way to bypass your PIN or password, but that feature was removed in Android 5.0. Unfortunately, this means there's no built-in way to simply reset your pattern, PIN, or password and gain access to your phone or tablet. This does help provide additional protection to your data, however —attackers have no way of bypassing the passcode unless they actually know it. RELATED: Use Smart Lock in Android 5.0 and Never Unlock Your Phone at Home Again Android's Smart Lock feature may be able to save you. For example, let's say you've set up Smart Lock on your Android phone and have it automatically log in when it's on your home Wi-Fi. You can take your phone to that home Wi-Fi network and it will automatically unlock for you, even if you can't remember the normal unlock code. You're left using a few other tricks that might work. For example, on Samsung devices, if you've logged into the device with a Samsung account, you can go to the Samsung Find My Mobile website, log in with the same Samsung account, and use the "Unlock my screen" option to remotely remove your device's lock screen. Other manufacturers might potentially offer similar features if they have a device-tracking website if you've signed up for. If you've already unlocked your bootloader and installed a custom recovery, you may be able to use that environment to remove the code. However, it probably won't be possible to install a custom recovery without factory-resetting your device if you haven't already done so. Android 4.4 and Below RELATED: How to Bypass and Reset the Password on Every Operating System Older versions of Android—Android 4.4 KitKat and older—have an integrated way to bypass your pattern, PIN, or other password if you forget it. To find this feature, first enter an incorrect pattern or PIN five times at the lock screen. You'll see a "Forgot pattern," "forgot PIN," or "forgot password" button appear. Tap it. You'll be prompted to enter the username and password of the Google account associated with your Android device. When All Else Fails! Factory Reset Your Device Assuming you don't have the easy option to reset the device using one of the tricks above, you should probably give up on the data stored on your device. You can get your device into a usable state again, but that will involve performing a factory reset, wiping the device's storage, and setting it up again from scratch. This isn't as bad as it sounds, as most data on a modern Android device should just sync online. Sign in with the same Google account and you'll have access to your emails, contacts, apps, and practically everything else. You'll then be able to set up a new unlock code. If your device has a removable SD card, you'll probably want to remove the SD card before performing the factory reset, just to ensure any files stored on there won't be overwritten. It's probably best to shut down your Android device, remove the SD card, and then continue. RELATED: How to Find Your Lost or Stolen Android Phone If your device has Google's Android Device Manager enabled, you can visit the Android Device Manager website and log in with the same Google account you use on that Android device. Select the device you're locked out of and select "Erase" to remotely erase it. You'll be able to set it up from scratch afterwards — the lock code will be removed, but the device will also be wiped. Note that the "Lock" option in Android Device Manager will only allow you to set a new lock code if your phone or tablet doesn't already have an unlock code, so it can't be used to remove an existing lock code. If you've enabled another remote phone or tablet-tracking service, you can probably use its website to remotely wipe your device, too. If you haven't enabled Google's Android Device Manager on your phone or tablet, that's fine. You can factory-reset your phone or tablet even if you can't unlock it. RELATED: How to Factory Reset Your Android Phone or Tablet When It Won't Boot The exact way you'll do this is different on different phones and tablets. You'll need to boot into your device's system recovery menu and wipe it from there. To do this, you'll need to turn the device off and turn it on while holding the correct buttons. For example, on the Nexus 4, you have to press and hold the Volume Down and Power buttons at the same time. On the Nexus 5, you have to press and hold the Volume Down, Volume Up, and Power buttons at the same time. Use the recovery menu to wipe the device. Google offers a list of ways to access recovery mode on Nexus devices. You may have to perform a web search or check your device manufacturer's support pages to find out how to reset it. On devices running Android 5.1, you may have to enter the username and password of the Google account that was previously associated with the device after doing this. This prevents someone else from resetting and using your device. However, you won't need the old unlock code to regain use of your hardware. Modern Android devices work a lot more like Apple's iPhones and iPads. If you forget the code, you'll need to reset it to its factory default settings to regain access. This begins to make sense when you consider Google's desire to automatically encrypt all Android devices out-of-the-box. The PIN or password is used as part of the key to decrypt the data stored on an encrypted Android device. Image Credit: iShnMFaz on Flickr, Best and Worst Ever Photo Blog
