Unlike the automatic transmissions that use lib, empty and pressure to change the gears, the driver selects the gear to use and determines how long the gear is maintained. Many things must be considered when removing and reconstructing a manual transmission. The installation of a manual transmission can also be diffused due to the weight and lack of balance of the transmission. Disconnect the negative battery cable. Use the floor cat to lift the vehicle high enough to place two Jack supports under the back of the frame and two Jack supports under the front of the With the help of an assistant, place the manual transmission in a transmission mutual cat. Establish the transmission housing in the Cat and Cinch crib the four final tweezers against the case housing. Close the two security chains completely around the transmission transmission case Join the links with two bolts and nuts. Press your nuts. Slide the transmission cat under the vehicle. If you have left the link of the switch lever and the connected arm, keep a transparent route to enter the passenger cabin through the opening of access to the plate. Bomb the connector handle to lift the transmission. The input axis of the transmission must be parallel to the opening in the bell housing. Move the transmission forward. Make front and stern adjustments on the front and rear slope on the transmission cat to align it. Use the stern and lateral sloping knobs in the connector to reach the correct alignment plane. Push the input axis of the transmission to the clutch opening and the pressure plate. Align the splines of the input axis with the splines of the clutch. To help align the splines, turn the transmission on your side axis by turning the side edges on the cat. Once aligned, push the transmission completely forward to the end of the transmission axis seats in the pilot bearing hole. If you have a 1/2 inch gap between the housing and the transmission, the pilot bearing did not align properly. Remove and insert again. Install the hand-borne mounting bolts on the threads of the bell housing. Press them with a torque key, according to the specifications of your repair manual. Turn the knobs to loosen the hugs of cat by hand. Remove the nuts and bolts in the safety chain and remove the chain. Push the transmission cat away from the vehicle. Connect any cable to the transmission that belongs to the solenoid or to the speed sensor, if so equipped. Loosen and remove the side gear oil accessory with a keyFill the transmission gearbox with prescribed gear oil, according to the specification of its manufacturer. Screw the filling plug and Ausplace with a plug. Insert the clutch pedal rod to the articulation of the handle throwing pivot. Retire pull fork to put it in your seat. Use an open key to adjust the free clutch pedal game. Insert the axis of the unit axis into the transmission output axis. Correctly align the thrust lines the axis of the unit forward until it is based. Connect the rear U-joint to the rear differential yoke. Insert the bolts through the universal ends of union. Ausparacio to the yoke with a shot. Replace the central console inside the passenger cabin around the displacement handle. Undress the console with screws or bolts (provided) with a screwdriver or plug. Use the floor cat to lift the vehicle and remove the cat support. Reconnect the negative battery cable and tighten the terminal to the batteria post with a socket. Start the engine and observe the clutch pedal operation and the displacement movement. Adjust the free or clutch -free pedal game, according to the manufacturer's specifications in your repair mantial. The requested URL was not found on this server.
