Note, however, that download and install updates sometimes takes time and can be intensive for resources. We are back. Windows 7 users can finally return to the normal world, where the corrections of operating system bugs are installed in a reasonable amount of time. A few days ago, Woody Leonhard wrote about a verse Improved Windows Update for Windows 7, which installs bug fixes in mere minutes instead of hours or days. I tried in three windows 7 machines, and it works well, bug fixes more fast than a speed bullet. This updated Windows update is only for those in knowledge, but reading this blog makes you one of the few privileged ones. Spread the word. The procedure for installing the fourth version of Windows Update as Woody describes, is a little intimidating in the beginning. The biggest complication involves Bluetooth in Execution on Intel Hardware. What installs a new Windows update has to do with Bluetooth? Only Microsoft knows. Just say (Woody has the generous details) that the new Windows update can break Bluetooth. So, the defensive computing thing do is make it a restoration point or an image backup before making any es.intel Driver updates Woody suggests first update your driver ¢ Bluetooth using the utilities Intel Driver Update River. I was not impressed with the software. On the one hand, install the .NET Framework Version 4.5, without any warning or front warning. So, he asks you to join the Intel Product Improvement Program. So, you have to restart after installing it. And when I first ran the software (verses 2.6.1.4), it was as slow to start that I thought something had gone wrong. Worse, were the results; This wanted me to install two different versions of a graphic driver. Why two versions? Did not you say.still not convinced? The .NET Framework 4.5 version that Intel installed, needed about a patchion duct. Nothing inspires confidence how to install software with known bugs. The final indignity is that when you do not install the Intel Driver update software, the Buggy .NET Framework remains. And sad to say, any Intel software should now be considered suspect. Back in April, the company announced that they were establishing 12,000 employees. There is no way to know which Intel software is still being kept and that has been abandoned, especially since the company is changing its focus away from the PCs. So, you may skip the Bluetooth driver update and wait the best. Windows Update has a Correction of Preme Bugs (KB3020369). Or maybe two (KB3177467 replace KB3020369), it's a bit confusing. The three pcs that I tested everyone had the necessary software needed, so this was a rabbit hole that I did not have to get down. One of the PCs was updated by the last time at the end of August 2016, another at the end of September and the third in the beginning of October. According to Woody, if the parent software is missing, you simply get an error message, nothing breaks.Doing the Dedto installs the round Windows Update, do 32 Bits or 64-bit version of a KB3172605 (links are in Woody article). So, I would reinnate. Woody does not suggest this, but it is always safer to install bug fixes in a newly initialized system instead of one that is running by a So, Woody says to go offline, without saying why. My guess is that it ensures that Windows Update is not working, something Woody says specifically to check. Step 1 Installing the Windows Rapid Update in Windows 7 to install the software, run the downloaded .msu file. As Above, he starts asking if you want to install KB3172605. The installation took about 30 seconds on my computers, hopes you would look like the screen capture below. Step 2 to install the fastest version of Windows Update in Windows 7 then it installs, you have to restart. Back Online, and Windows Update should be Zippy again. The installation of KB3172605 creates your own restoration Point.My 3 test computers observed earlier, I tested this in three windows 7 machines. None of them had Microsoft Office installed. The speeds that refer below are all in the first phase of Windows Update, where it detects the missing corrections. The download and install phases have never been slow (if they are, this is a different question). The first computer I tried was a desktop machine without Bluetooth (bullet dodged). The bug fixes of the last time were installed on the pc was September 28th.earlier on the day, Windows Update took place for so many hours on this machine I lost control and turned off the device to put it out of your misery Ria. So, after installing the fast verse, it only took three minutes (more or less) to find the missing patches. This is how I learned that the V4.5 Framework .NET recipe, that the Intel driver utilter had installed, it was so buggy.i un-installed the .NET Framework 4.5, restarted and ran Windows Update again. This time it took about 20 seconds. Yes, this is seconds not for hours. You found groups (aka cumulative packages) ("Oct 2016 Rollup quality monthly safety ...") and .NET Framework ("Oct 2016 Security. Quality Rollup for the .NET Framework 3.5. 1 ... ") Corrections. He also found a definition update for Windows Defender and the October Edition of Windows Malicious Software Removal Tool. Nothing noticeable here, but from Timing.Next, I tested a laptop that never uses Bluetooth (bullet dodged again) and the last one had been updated August 28. The new and improved Windows Update led Abouta 5 minutes to find 8 missing fixes. There were individual spots from September 13 and 20, together with the same updates as the first third machine machine.The was another work area (once again, no bluetooth problem to deal with) where the In the last bug fixes were installed October 2nd.The wrinkles here was that I could not take off-line machine. He was being controlled remotely and had no keyboard, mouse or monitor connected to it.GamBling that the point of offline was to ensure that Windows Update was not running, I stopped the Windows Update Service to run the .msu file. Everything went well, and the new and improved windows update took about a minute and a half to find 5 missing patches.Initially however, the newly-installed Windows Update failed on this machine with an error 80244019. One minute later, It worked well. My guess is that this was due to the late startup for the Windows Update service. I was very anxious to play with my new toy. View of a thousand feettaking a step back from the trenches, it is important to note that Apple and Google have no problems installing bug fixes for your operating systems. Users of iOS, X, Macos, Android and Chrome do not have to deal with anything remotely similar to the situation described above.yes, I know most Android devices do not Get bug fixes at all, but this is a different question completely. When there are available android corrections, the installation process is reasonably straightforward.Windows 7 users, like me, have suffered slow patch installations for months. There is a correction available, but we have to learn about it in our own, and potentially deal with the correction break Bluetooth. Then, if the needy premise software is missing, we have Decide whether to install KB3177467 or KB3020369. And, what is the business with stains that are not verified by pattern missing? If the correctness is missing, why not install it? This Windows 7 users have to deal with things to this level is archaic on this day and age. An operating system should only work.google is The path here as Chromebook users can attest. And, the latest Android, in run on the latest hardware, will update the operating system so perfectly as Chrome OS. This is the future. I like Windows 7, but it's a dinosaur.
