Discord for linux

By ExtremeTech Staff on May 30, 2001 at 12:00 am This site may earn affiliate commissions from the links on this page. Terms of use. This is your resource for official versions of the Linux kernel source code. It's operated by Transmeta, where Linus Torvalds, the father of Linux, works. By ExtremeTech Staff on August 27, 2001 at 12:00 am This site may earn affiliate commissions from the links on this page. Terms of use. This free program has its roots in Powertweak for Windows; Powertweak Linux optimizes your CPU and connected devices by adjusting hardware settings. It sets (and lets you adjust) values for data prefetching, cache features (write allocates, linear bursts, etc.), shared memory, and more. Discord is a popular, free voice and text chat app for gamers. To make the most of this communication app for gamers, add your friends to it. There are several ways to add people on Discord, including from their profile and by using search. These instructions show how to add friends on Discord using the desktop web browser version of the Discord server dashboard. While the Discord app is available for iOS, Android, Windows, Mac, and Linux devices, instructions for the web browser version should be enough to cover how to add friends on Discord, regardless of your operating system. The fastest way to add people on Discord is to search for your friends using their Discord user tag. Log in to your Discord account from the Discord app web browser login screen. From the Home screen on your Discord account's dashboard page, select Friends, located on the left side of the screen. The Friends menu opens on the right side of the screen. At the top of the menu, select Add Friends. This opens a window containing a large search box in which you can search for your friends by their username, also known as a DiscordTag. In the large search box, enter the DiscordTag of the person you want to add. When you finish typing, select Send Friend Request, located at the end of the search box. The DiscordTag consists of a case-sensitive username, a pound sign (#), and your friend's 4-digit DiscordTag number. If you didn't find your friends using search, add people using their Discord profile, but some caveats apply. This method doesn't allow you to add a friend from their profile if they aren't part of your Discord server or you aren't joined to their server. You must have at least one server in common, preferably your server. Log in to your Discord app account from the web browser login web page. From your account's dashboard screen, on the left side of the screen, select your profile icon, which is located beneath the Home screen icon (the Discord logo). Selecting your profile icon opens your server's dashboard. On the right side of this screen is your chat list. The person you want to add as a friend on Discord should be listed on this chat list. Right-click the person's name, then select Profile. A small, black dialog box appears, showing your friend's profile summary. Select Send Friend Request. You can also add someone on Discord if you've been in a chat with them before. It's a fast way to get connected to people you already talk to. Log in to your Discord account via the web browser login web page. Select your profile icon, located on the left side of the screen, under the Home icon. Go to your chat list, located on the right side of the screen. Right-click the person in your chat list you want to add. From the menu that appears, select Add Friend. Thanks for letting us know! Tell us why! This article covers how to find Discord servers using the Discord app, online directories, and other resources and how to sort out the best Discord servers from the ones that you should avoid. Discord servers are essentially advanced online discussion forums with extra functionality like voice chat, system notifications, and app support on both computers and smart devices. There are hundreds of millions of Discord servers to join on almost every topic imaginable, from Discord dating servers to servers dedicated to gaming and anime series. The easiest way to find public Discord servers is to use the built-in server search on the Discord desktop app. Open the Discord app on your computer. Click the Explore Public Servers icon that looks like a compass. You will land on the official Discord server directory's front page with a search bar at the top and several popular Discord servers underneath, such as those dedicated to the Fortnite video game and Minecraft. Click any of these to see what their community is like and how active they are. If you like a Discord server, all you need to do to join is to click on the Join button at the top of the screen. You can also click the compass icon again to return to the main directory. In addition to the featured popular servers, you can also discover other Discord servers to join by navigating via the categories on the left menu. The categories available are Gaming, Music, Education, Science & Tech, and Entertainment. Another way to find Discord servers is to use the search bar. It can be helpful if you're not sure which category your preferred topic fits in or if it relates to more than one category. One example of such a topic would be Star Wars which has Discord servers dedicated to Star Wars video games such as Star Wars Battlefront II and The Old Republic. There are also servers for its movies and Disney Plus series like The Mandalorian, Ahsoka, and Rangers of the New Republic. One alternative method for finding Discord servers to join is to browse online Discord server lists via an online directory. Here are some of the more popular Discord server directories worth exploring. Disboard.org: The largest Discord server directory with categories for learning languages, music, LGBT, and politics in addition to the usual video game topics. Discord.me: Another reliable server directory with thousands of options per category. DiscordServers.com: This directory features a massive selection of gaming and geek culture Discord servers to join. You can find popular Discord servers via the built-in server search or one of the above directories, but you can also discover many elsewhere online as well. Find Discord servers on social media. Many companies and individuals will often share their Discord servers on social networks such as Twitter, Facebook, and Instagram. Join exclusive servers via Patreon. Patreon features strong integration with Discord, and many creators offer exclusive access to private Discord servers to their supporters. Check Facebook Groups for servers. Some Facebook Groups also have Discord servers for their members to connect in. Video game streamers are all about Discord. Many small and large streamers on Twitch, YouTube Gaming, and Facebook Gaming own their Discord servers for their community to chat about their streams, gaming, and other related topics. Check your favorite streamer's profile page to see if they have a Discord server to join. You can join as many Discord servers as you like, so feel free to browse and search until you find the online community that's best for you. However, if you're finding it hard to find the correct server, why not create a Discord server and invite others to join and build a new community with you? Thanks for letting us know! Tell us why! Click Create a server, type in a name , and click Create. Click Invite next to contacts. Click Edit invite to change the expiration date and other settings. Set up roles: Right-click the server icon. Click Server Settings > Roles. To add a role, click the + next to Roles. Name it, edit settings, then click Save Changes. This article explains how to start a Discord server and set up Discord server rules on Windows, macOS, iOS, Android, or online. The steps below show you how to set it up using a Mac, but the steps are similar for all platforms, even if button placement differs slightly from platform to platform. If you already have servers set up and signed in, you'll find them on the far left. Below that, click +. If you are a brand new user of Discord, when you first open the app, you'll be taken right away to the screen shown in step 2. Click Create a server. Type a name for the server, then click Create. Click Invite next to any Discord friends to invite them to the server. At the bottom, you'll find a unique Discord invitation link. If your friends are not on Discord already, you can copy that link and send it to them in a message. Optionally, you can click Edit invite link, and you can set a different expiration date for the link and cap the number of times people can use the link. Lifewire/Adam Doud That's it! You have now created a Discord server. Before your friends start showing up and making a mess of the place, you can assign roles to different server members. Roles in Discord are essential to make sure that you have some amount of control over your server. You can set as many types as you like. Typically, you'll find roles like Administrator, Moderator, Member, and others like that. Each has its own set of permissions for actions they're allowed and not allowed to take. To set up roles in your Discord server, right-click the icon for your server in the bar to the left. You can also get into settings by clicking on the icon for your server and clicking the down arrow next to your server name. Click Server Settings > Roles. By default, all servers have one role called @everyone, which lets you assign permissions to all server members. To add a role, click the + next to Roles. Change the name under Role name. From there, you can change any permissions you'd like for the new role. Once done, click Save Changes at the bottom of the screen. Discord will not allow you to close the new role box until you have saved your name and permissions. You can set up multiple roles and different permissions for each one this way. The @everyone role will be the default role for new members as they join the server. When a new user accepts your invitation, they'll automatically be assigned the @everyone role. You can change their role right from the list of users on the right. Click the name of person whose role you want to change. Click the + under No Roles. Select the role you want to assign. You may decide at some point that you're micromanaging your users too much. You can easily delete the roles you created in Discord. Right-click the server icon on the left. Click Server Settings > Roles. Click the role you want to delete and scroll all the way to the bottom of the screen. Click Delete. You can only delete the roles that you created. You cannot remove those created by bots. If the delete button is missing, a bot likely made it. There are some essential things to know about roles in Discord. Users can have multiple roles. For example, a user can be a moderator and an admin. Each one can grant different permissions depending on what you set. If a user has no assigned roles, they'll get the permissions assigned to the @everyone role. Roles can only be manually assigned to users one user at a time. If you remove one with 900 users and then change your mind, you'll need to reassign 900 users one at a time. Bots can help with this. Some services that integrate with Discord, like Patreon, use bots to auto-assign roles to users. Thanks for letting us know! Tell us why! Start with the glowing Xbox icon controller button. Then go to Profile & System > Settings > Account > Linked Social Accounts > Discord > Link. You can only do this on Xbox One. Sorry, Xbox 360 owners. Before you start, be sure you have an existing Discord account. This article explains how Xbox owners can now link their Discord account with their Xbox network account. The functionality is very limited right now, but it can be useful. Connecting your Discord account to your Xbox One is fairly simple provided you know how to do it. The options required for Xbox One integration are a little hidden away. Here are the steps needed to connect the two. On your Xbox One games controller, click the glowing Xbox icon button in the middle of the controller while your Xbox One is switched on. Scroll right until you get to Profile & System. Click Settings. Scroll down to Account. Click Linked Social Accounts. Scroll right and click Link underneath Discord. Press A. Click Yes. On your phone, open the Discord app. If you don't already have it installed, install it from the App Store or Google Play Store. You can also follow similar steps via the web-based version of Discord. Tap Settings. Tap Connections > Add. Tap Xbox Live. Enter the code displayed on your Xbox One. Your accounts will now be linked. It's possible to link your Discord account with your Xbox One but right now, functionality is very limited. Currently, all you can do is view what your friends are playing on Xbox One via your Discord account. That's not much but it can be useful if you have a lot of friends who play Xbox games and you want to be able to check via one source what they're playing right now. With limited Discord/Xbox One functionality, there's currently not much you can do with a linked account. Here's an overview of what you can't do yet. You can't chat to your friends. Possibly the most important thing that Discord users want to be able to do, there's no cross-platform voice chat so you can't talk to friends on Discord via your Xbox One. This applies to both text and voice chat. You can't chat in a chat channel. Got a beloved favorite Discord chat channel? You also can't converse there on your Xbox One or even simply browse what other people are posting at any time. You can't add friends. Want to add a new friend to your Discord account? You'll need to do that via the app or browser. You can't do this via the Xbox One. You can't join a new server. It's not currently possible to join or add a new server to your Discord list. Thanks for letting us know! Tell us why! Discord was originally designed to cater to the needs of the gaming community. This should be rather evident when it comes to most of their features. Having come a long way since it publicly released in May of 2015. Discord has taken the Voice over Internet Protocol (VoIP) scene by storm, and has shown no signs of stopping anytime soon. That all being said, Discord is not the only VoIP application in town with something to offer. There were multiple VoIP services to choose from before Discord, and there are still more Discord alternatives being released today. Not everyone is pleased with the service that Discord provides. There have been concerns over privacy, hacking vulnerabilities, and rumors that, in the past, Discord has been a breeding ground for unsavory communities. For some users, these complications have proven too worrisome, and cultivates the desire for Discord alternatives. Top Discord Alternatives There are plenty of varying alternatives to Discord, depending on what you need a VoIP service for. Not all of the choices are dedicated to gaming as their primary focus quite as Discord does though. Below, you can find what we feel are the top VoIP Discord alternatives. TOX Anyone whose primary concern is with security, Tox provides it in spades. Built-in military-grade encryption gives Tox users superior protection. This makes things perfect for those who are in need of a VoIP app for having a conversation on topics other than video games. The interface may appear a bit dated, but if you can look past it, you'll find that Tox has a lot of great features. Tox has support for text, voice, and video chat, not to mention a nifty screen-sharing feature. File sharing is also available on the platform making Tox a great VoIP service for professional and business settings. What truly separates Tox from the others on this list is that it has zero central servers. Instead of relying on a server that could face complications like outages and shutdowns, the entirety of Tox's network is comprised of the users. You can find the Tox app on mobile devices, macOS, Windows, and Linux. Riot.im Another service that destroys Discord in the online privacy game would have to be Riot.im. This VoIP Discord alternative service is offering end-to-end encryption on all text and voice chat communications. The service is primarily meant for team collaborations and backs up that claim with a bunch of tools to help streamline a team's workflow. The entire service is built on the Matrix open communications protocol which means that Riot.im will allow you to talk with anyone within the Matrix.org ecosystem. Riot.im enables users to share messages, images, videos, and files and can be downloaded on Windows, MacOS, Linux, Android, and iOS. Slack Keeping with the team collaboration trend, one cannot forget about Slack. Prioritizing professionals, as far as the UI is concerned, it's practically Discord without the gamer feel. Instead of a haven for gaming, Slack offers an abundance of productivity features to improve your workflow. The app provides integration with 800+ third-party pieces of business software and supports uploads of up to 1GB. When compared to Discord's 8MB, you can tell that Slack is all about the business. Of course, you can only get these amazing features in the paid version of the app as the free version offers very limited functionality. Even still, the professional setting and lag-free voice comms are more than enough to satisfy business-oriented teams in the market for a Discord alternative. Overtone If you still want something that has the look and feel of Discord without actually being Discord, then Overtone may be your preferred VoIP service of choice. Similarly to Discord, Overtone is designed with the gamer in mind. Overtone is completely free and is based on Vivox integrated chat services, which have been widely used by League of Legends, Fortnite, and PUBG players. It also supports both voice and group chats, direct messaging, and community creation. Ventrilo An oldie but a goodie, Ventrilo is a lightweight Discord alternative boasting low latency voice calls and lightweight design. This means you won't have to worry about your VoIP service draining your computer's resources. All Ventrilo communication is encrypted, so privacy should not be a concern. Ventrilo's UI will take some getting used to if you've already settled into that which you'd find on Discord. Some may find it outright complicated if not coming from a similar VoIP service like Teamspeak3. The features are relatively minimal outside of positional sound customization, but for what it does offer, it does well and carries no complaints. TeamSpeak3 As it's already been mentioned, we might as well cover it. TeamSpeak3 is among the oldest chat apps for gaming communication. So many gamers used to rely heavily on TeamSpeak for their in-game communication. To ensure low-latency comms, TeamSpeak uses opus codec, which is a coding format that was designed to efficiently code speech and general audio into a singular format making it unmatched for interactive speech and music transmission over the Internet. Teamspeak3 also provides users with the opportunity to create their own dedicated server. o ensure low-latency comms, TeamSpeak uses opus codec, which is a coding format that was designed to efficiently code speech and general audio into a singular format making it unmatched for interactive speech and music transmission over the Internet. Teamspeak3 also provides users with the opportunity to create their own dedicated server. TeamSpeak3 provides security in the form of AES encryption to ensure all conversations are safe from malicious entities. However, unlike the others on this list, TeamSpeak3 offers no browser support so you will need to download and install the app in order to use it. There's also a price tag if you plan to use it on iOS or Android, but it is available free on MacOS, Linux, and Windows. Skype If all you desire is a service that offers free team communication and basic functionality, Skype is always there. It's a familiar service that is still quite popular and offers features like screen share, video chat, and file-share. Not much benefit to gamers but in a professional setting, Skype has the tools to come in handy. The only real annoyance is the potential to weigh heavy on your computer's resources creating irritating lag problems while attempting other things. The basic service is completely free. The only cost comes when using Skype as an international phone service. The app is available on all major platforms, some of which may be integrated.
