Aside from pencil and paper, there are many digital tools for creating wireframes, the [Lo-fi](#) layout of a web page that helps you determine its basic structure before adding the visual design. One advantage of using Photoshop CS6 as a wireframing tool is that you can use the wireframe as the basis for your detailed mockup, rather than having to start from scratch. The image below reveals the [Anapkin sketch](#) that my fictitious client has enabled, which is a way to provide a wireframe. Frame. After talking more with my client, I collected additional requirements for the home page: the client wants a "more button" after the title and the text of the introduction. There won't be more than two quotes in [What people say](#)...the customer likes the idea of having a color or background image with an area of canned content that is White. Time to activate Photoshop and create a wireframe that takes into account the actual size and provides a slightly more polished look. Start by creating a document based on the 960 grid system (which you can learn in the section called [Sitting on a Photoshop grid](#) found in the Free Samples Chapters) that is 1,100 pixels wide by 750 pixels high. If you wish, use the Paint Bucket (G) tool and fill the background with a light grey color to represent that there will be a background color or image. Close the rectangle (U) tool and draw a box to represent the area of the content. Since I use the 960 grid system, my box is 940 pixels wide. I made the white foreground white so that it occurs against the grey background. To make the process faster, type D to set the foreground to black and the background to white. Pull black boxes to represent the content areas, then change the opacity to make them appear grey, as shown here: rectangles to represent the logo and navigation following the grid, add a rectangle to represent the logo. Lower the opacity of the rectangle by immediately typing an opacity opacity (a" "30A" a") After drawing the rectangle. If you wish, add the text using the Type (T) tool to add the [ALO](#) text on the box. Add another rectangle to represent the navigation area, and again, lower the opacity value to make it grey. You may want to add rectangles to help indicate the areas of the content column. The next picture shows that I decided on a two-column layout with a slightly larger main content column and a smaller column for the home page image. I set the opacity to 10% for columns and also added another rectangle to represent the footer at the bottom of the page. Size of the columns of the page. Direct rectangles to represent the content areas within the columns. You may also want to add dummy text using Photoshop's Pasta Lorem Ipsum Command. My completed wireframe can be seen here: creating a rough wireframe like this gives the client a sense of where the content goes on the page, but allows quick and easy editing if you need to move items around.
